

Project title: Import Data Using Transform Maps

Phase 2: Requirement Analysis Phase

1. Comprehensive Functional Requirements

The core functional scope dictates what operations the developed ServiceNow framework must successfully execute:

Bulk Data Processing Interface: The platform must natively accept standard Excel spreadsheet files containing multi-row corporate employee data payloads.

Staging Data Hosting: The system must dynamically generate an isolated import staging table (u_employee_import) to store raw inputs before transformation execution.

Schema Mapping Matrix: The mapping engine must perfectly mirror 5 critical operational attributes from the source file into the core target fields: Employee ID, Employee Name, Email, Department, and Location.

Dynamic Record De-duplication (Upsert Logic): The application must evaluate incoming data using a unique criteria key. It must automatically catch duplicate IDs, preventing double entries by updating matching profiles while simultaneously executing new profile insertions.

Analytics Engine Generation: The tool must allow administrators to build visual charts directly linked to live record entries.

2. Strict Non-Functional Requirements

High System Performance: The platform transformation engine must successfully process all incoming data rows within a rapid benchmark window of less than 5 seconds.

100% Data Integrity Assurance: The mapping layout must completely prevent any data dropping, truncation, or field mismatching during the migration loop.

Privileged Dashboard Security Bypassing: To circumvent strict default platform access control blocks on backend forms (PA_DASHBOARDS.FORM), system Access Control Lists (ACLs) must be altered to grant full design rights to designated administrative accounts.

3. Detailed Hardware and Software Requirements

Platform Environment: ServiceNow Personal Developer Instance (PDI) running San Diego, Utah, or Washington DC release builds.

Local Workspace Tools: Microsoft Excel, Google Sheets, or LibreOffice Calc to author, format, and export Excel test spreadsheets.

Client Interface Tool: Modern high-performance web browser (e.g., Google Chrome or Mozilla Firefox) with enabled JavaScript support.
