

# Project title: Import Data Using Transform Maps

## Phase 7: Project Documentation Phase

### 1. Step-by-Step Platform Administrator Guide

Follow this operation lifecycle guide to perform ongoing delta spreadsheet updates securely:

1. Spreadsheet Ingestion Preparation: Ensure that the input Excel file headers are placed on row 1, matching the required parameters exactly (Employee ID, Employee Name, Email, Department, Location).
2. Access Data Loader Interface: Search for Load Data in the Application Navigator console.
3. Target Staging Allocation: Click the Existing Table radio check option and select Employee Import (u\_employee\_import) from the dropdown menu.
4. Payload Processing: Click the file browser button, select the updated spreadsheet asset from your local device, set sheet number to 1, header row to 1, and click Submit.
5. Launch Mapping Engine: Once the file upload completes successfully, select Run Transform from the next steps prompt.
6. Execute Database Sync: Choose Sample Spreadsheet Import from the map matching layout choices and click the Transform action button to complete the process.
7. Audit Log Verification: Open the Transform History log to confirm the breakdown of inserted, updated, and ignored rows.

### 2. Advanced Security Access Bypass Configuration Guide (ACL Fix)

By default, standard ServiceNow security restrictions may prevent administrators from creating dashboards using the backend form format (PA\_DASHBOARDS.FORM). Use this override guide to bypass this restriction:

1. Search for Access Control (ACL) in the Application Navigator panel settings.
2. Filter the access rules column by searching for pa\_dashboards under the Name field column.
3. Locate the row where the Operation type is set to Create and open the record form.
4. Scroll to the security parameters layout configuration and check the box to set Admin Overrides to True.
5. Save and update the form. This securely updates system permissions, allowing administrators to access and deploy custom dashboards directly.

The screenshot shows the ServiceNow web interface for the 'Access Control - pa\_dashboards' record. The form is divided into several sections:

- Form Fields:**
  - Type: record
  - Operation: create
  - Admin overrides: ☒ (highlighted with a green box)
  - Decision Type: Allow if
  - Protection policy: -- None --
  - Name: pa\_dashboards
  - Description: Allow create for records in pa\_dashboards for users with role maint.
  - Application: Global
  - Active: ☒
  - Advanced: ☐
- Conditions:**
  - Access Control Rules have two decision types, and these types will behave differently depending on conditions.
    - 1. Allow Access: Allows access to a resource if all conditions are met. Additional ACLs may grant access to records where this ACL has not granted access.
    - 2. Deny Access: Denies access to a resource unless all conditions are met. Additional ACLs may not grant access to records where this ACL has denied access.
  - [More Info](#)
  - Requires role: 1 to 1 of 1
  - Role: maint
  - Security Attribute Condition

The bottom of the screen shows a Windows taskbar with the date 28-09-2026 and time 18:48.
